CARE INSTRUCTION FOR YOUR CARNIVOROUS PLANTS

PLANTING MEDIUM

Use sphagnum moss with peat moss and river sand.
You may also wish to use some perlite, no more than one fifth of total medium.
The plant will fertilize itself by digesting insects that fall in it.

WATERING

Keep your planting medium very damp as long as the temperature is above 60 degrees F.
Reduce water as temperatures cool below 60 degrees F while the plant is dormant.
Never let the soil dry completely, it should remain relatively moist at all times.
Use only purified or filtered water.
Minerals are hazardous to these plants.

ENVIRONMENT

The temperature should be between 25 and 95 degrees F, and humidity between 50 and 90 percent.
Full sun is desirable part of the time to help protect the plant from fungus.
It will also produce bright coloring.
