

Flashing & Air Sealing Techniques for Exterior Doors

Presented by: DuPont | Booth #2402

Imagine a builder who does not flash a home's front door entrance assuming that a porch or roof overhang is sufficient enough protection. That will not pass muster with a third-party consultant. Adopting a consistent best practice program for the installation of exterior doors will help prevent water intrusion and minimize air infiltration. Come learn how to utilize a dual-sided adhesive specially designed for brick mold, non-integral flanged and non-flanged doors to protect homes from moisture. Then, watch as we move to the interior of the door to demonstrate air sealing techniques. This demonstration will include a door installation.
