The Concrete Fence Molds we manufacture are available in the United States and throughout the world. No licenses or future purchase commitments are required.

The precision engineered molds produce concrete fence components that display the deepest textures and patterns available. Those features make the panels between the posts appear as one unit, rather than six, twelve inch individual panels.

Our proprietary recipe for blending the highest quality polyurethane prevents it from decomposing in the molds from the abrasive attack from concrete, providing many years of trouble-free filling and stripping of the molds.

The fence molds are packaged in sets:

1- 12 panel gang mold  
2- Post molds  
2- Cap molds

Each set requires 1 yard of concrete which yields 10 lineal feet of 6 foot high fence per pour. In order to produce 50 lineal feet per day, 5 sets of molds would be required.

Details for successful production are included with the molds.

There are many applications for concrete fences:

• Surrounding walls and garden fences  
• Sound Barriers  
• Perimeter security enclosures utilities, municipalities and businesses  
• Affordable buildings for use as houses, schools, and hospitals
