

Use this pacifier to help the medicine 'go down'

Pedi-Neb is designed to enhance the delivery of aerosolized medications while reducing the apprehension associated with this type of treatment. The pacifier helps calm the child during treatment. Medication is inhaled through the nose—not the mouth—through a port that properly directs the aerosolized drug and eliminates the waste associated with the “blow-by” technique. According to the manufacturer, the latex-free device works with any type of nebulizer. For more information, contact Westmed at www.westmedinc.com.
